

SPECIAL EPILATOR LASER HAIR REMOVER

How Our Laser Hair Remover Works ?

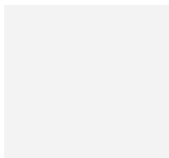

Hair Removal Device emits powerful light pulse when applied to the surface of your clean, shaved skin. The light travels through the skin, more energy will be absorbed by darker area (with high concentration of melanin).

The hair shaft and bulb (root) are usually where the highest concentration of melanin are located. Once melanin absorbs the light energy, it is transformed into thermal energy.

Using laser hair removal on the underarms is perfectly safe. You may find that it is a more sensitive area to treat as the skin is more delicate than on the legs.
